

World-Class Version Control

Vault's version control gives you everything you need — reliability, atomic commits, excellent remote performance, flexible security, smart branching and merging, and more.

Built for Reliability

Vault was designed to ensure the reliability of data. All repository data is stored in a SQL Server database.

Remote Access

Vault was designed to work well over the Internet. All communication between client and server is done over HTTP, familiar and friendly for network administrators. Compression and binary deltas are used in both directions to minimize network traffic.

Advanced Features

Vault brings smart branching and merging to your team, including our Merge Branches wizard. And check out our exclusive Line History feature (think Blame on steroids).

Atomic Checkins

You can checkin a group of related operations as a changeset, and the checkin operation is atomic. The entire changeset either succeeds or fails. Your repository is never left in a half-baked state.

Cross-Platform Support

A Java-based command-line tool is available to access Vault repositories on non-Windows based operating systems.

SourceSafe Import

Vault's VSS Handoff feature gets you up and running in no time, with access to all of your VSS History, Shares and Pins. Discover the safer, faster, more-powerful world of Vault, and leave nothing behind.

Familiar User Interface

SourceSafe users can begin using Vault with no learning curve. The terminology is the same and all major VSS features are present.

Full-Featured Integration with Popular IDEs

All of Vault Pro's features are available in Visual Studio (including Visual Studio 2010) and Eclipse.

Build Integration

Vault Pro integrates with CruiseControl.NET to provide continuous integration and build support. We also provide Ant and NAnt tasks to access and update Vault Pro repositories from your build scripts, and a cross-platform command line client that can be called from any build tool.

Additional features exclusive in Vault Pro

Built-In Work Item Tracking

Vault Pro offers work item / bug tracking in your IDE or via your web browser. Work item tracking and version control are integrated, so you'll always know what work item a checkin relates to, and vice-versa. Customize the security to suit your team, create and save custom queries, and more.

Vault Standard

Version control for professional development teams.
